Its surface may also display mineral solids and bubbles that have formed and hardened while the item was being fired. Contrary to earlier assertions, they determined that both gypsum and lime mortars were used.

Rock Thin Sections (Petrographic Thin Section Preparation)

Firing occurred in a reducing atmosphere, producing gray pottery with reduced iron oxides and small amounts of carbon from organic matter. Thin-section analysis was also the primary method of a major study that characterized the calcareous cements used in pre-Hispanic Mesoamerican building construction.
