V. Dietz

The common marmoset as a novel animal model system for biomedical and neuroscience research applications. Responses To object texture and weights.

Neurophysiologic studies of functional neurologic disorders

. Visual oscillatory and somatosensory oscillatory and evoked responses were imaged, and intraclass correlation coefficients ICC were computed to examine the long-term reliability of these responses. .

V. Dietz

Direction and strength of outflow depend on grip type and epoch In order to study the effective connectivity between cortical areas, PSI was computed for all channel pairs. Patients' data were examined adopting ASIA and modified Frankel definitions in order to compare the two classifications in terms of consistency and prognostic value. Strength of connectivity between cortical areas differs across grip types and epochs In order to better understand the interactions between cortical regions, we estimated the direction of information flow by using the PSI Nolte et al.

TSpace Repository: Statistics

However, we showed a number of differences between epochs in sensorimotor cortex, for a subset of grips — namely finger and scissor grips — associated with small objects. Additionally, forelimb motor representation Fig.

Libros:

C and F were obtained as follows. Front Syst Neurosci 4, 38. A combined histological and MRI brain atlas of the common marmoset monkey, *Callithrix jacchus*.
