

# Ecological effects of different land uses and management practices on temperate and mediterranean forest landscapes - final report.

Unesco - overgrazing

Description: -

-Ecological effects of different land uses and management practices on temperate and mediterranean forest landscapes - final report.

-

A New Portway large print book

MAB report series -- no.19 Ecological effects of different land uses and management practices on temperate and mediterranean forest landscapes - final report.

Notes: Report of the meeting held at Unesco, Paris, 16-19 April 1974.

This edition was published in 1974

## Genetic effects of forest management practices: Global synthesis and perspectives

Since we were unable to quantify the risk that long distance migrants are exposed to on their wintering grounds, these species did not accrue winter risk in our risk assessment.

## Global Projections of 21st Century Land

Since no significantly negative effects of forest system management practices were found for either lignin or C decomposition, we can conclude that C cycling was not negatively influenced by intensive forest management, although we could not quantify the exact amounts of leaf litter C release to the forest soil, since litter C can be released both to the soil and to the atmosphere.

## Effects of silvicultural treatments on forest biodiversity indicators in the Mediterranean

Modelling the effects of sanitary policies on European vulture conservation.

## overgrazing

These assessments should assign a greater role to ecological and social functions. Moreover, game hunting occurs preferentially in patches with scrubland, probably because of the greater ease of hunting with packs of dogs and shooting fleeing ungulates.

## overgrazing

Loss of resources as a driver of decline Although there are likely to be multiple drivers of forest bird declines in Europe, our results highlight that resource loss is a key concern. In addition CAP incentives for sheep, pig and cattle production have led to a significant increase in numbers of

animals per hectare and new methods of husbandry. One such reason is the marginality of grazing areas in the Mediterranean region made up of hilly and mountainous lands with relatively shallow and rocky soils and steep slopes resulting in low productivity and grazing capacity.

### **Global Projections of 21st Century Land**

Synergies between energy wood production and roundwood production mentioned by stakeholders pertain, for instance, to the energy use of logging residues as a by-product of final fellings without negative effects on wood production or to the harvesting of energy wood from young stands, which improves the growth of the remaining trees Finland: practitioner group. Calls, in view of the need to promote further synergies between innovation and creativity in science, for the introduction of arts education in STEM subjects to promote STEAM education, particularly for girls, in order to address societal challenges in reaching sustainability goals; 29. Dassiki Erevna, VI 2 : 155-168 In Greek with English summary.

### **Quantifying the Detrimental Impacts of Land**

Adjustment of the assessment procedure would be necessary to aid in preparing coherent strategies for example for land use and energy production. OPADRC, OEP and the 4 th Programming Period 2007-2013 of EU Financial Perspectives e.

### **Energy wood from forests—stakeholder perceptions in five European countries**

The good news is that a lot of people are already on the job doing exactly that - many smart growth advocates, practitioners of New Urbanism, and green developers and designers among them. Furthermore, climate change will increasingly play an important role in driving ecosystem changes. The genetic landscape of the Iberian red deer *Cervus elaphus hispanicus* after 30 years of big-game hunting in Southern Spain.
