Three Different Approaches to Qualitative Story Completion

What story completion can access	Type of research question	Examples from the literature
Essential psychological truths of the everyday: Stories access participants' deeply held personal beliefs and experiences around the topic of interest. The stories may be understood as revealing perceptions that may be not in participants' awareness or beliefs that a person would not choose to divulge. Because stories reveal what participants really think and feel, they potentially predict what they might say or do in a similar real-life scenario.	What do the participants think that about X?	Morse (1985) - girls' beliefs and feelings about menarche. Larsen and Teas (2000) - women's perceptions of their vulnerability to sexual aggression in a dating context.
Internationally situated and partial perceptions shaped by the participant's particular social context and location. Each person's stories provide data on the range of social understandings around the topic of interest that are available to them. For some participants it is possible that stories reflect aspects of their opinions or their personal experiences but their social reactions in a real-life scenario cannot be predicted from their responses, as any social reaction would depend on the specific context.	How do participants make sense of X in their particular social context?	Wolter and Tschetter (2010) - participants' assumptions about and understanding of illness and knowledge/convictions that it is (2010) - participants' social attitudes towards dating a person with physical disabilities.
Locally persistent discourses. Stories provide data on the range of social discourses around the topic of interest available to the group of participants. From this perspective, the idea that stories can provide any information about the opinions or experiences of individual participants is rejected; instead, there is a focus on what possibilities are available to individuals in the respective sociocultural and political context they find themselves in, for understanding a particular topic.	How is X socially constructed?	Shah-Rekhy, Clarke, and Thomas (2020) - the discourses around heterosex drawn on by therapists and counsellors. Frost (2013) - postcolonial discourses of sexuality related to orgasm.
