A mid

This palaeogeographic positive relief, which is underwater today, might have reduced considerably the distance of a possible biotic migration between South America and Africa.

Fossilworks: Pouterlabatia

Determinación xilológica de la madera fósil de una fagácea, de la Formación Río Turbio, Eoceno, Santa Cruz, Argentina. *Microlamia pygmaea*, a longhorn beetle Coleoptera: Cerambycidae, mines dead leaves on fallen branches. Modified meta-tree of with the inclusion of the fossils *Raiguenrayun cura* gen.

Fossilworks: Pouterlabatia

According to this scenario and previous biogeographical hypotheses, Asteraceae might have evolved in southern South America some time before the Eocene, and subsequently entered Africa, before the biogeographical isolation of these two continents became much more pronounced.

Southern beech (Nothofagaceae) fossil leaves from the Río Turbio Formation (Eocene

FINAL REMARKS The changing palaeobiological scenarios in Patagonia, during Mesozoic and Cenozoic times, as reflected by the palynobiota, are intimately related to the tectonic and climatic history of the supercontinent Pangaea during the last 250 Ma and to the elevation of the Andean Cordillera during the Cenozoic.

Mineralienatlas Lexikon

Análisis paleoflorístico de la Formación Río Guillermo Eoceno Tardío—Oligoceno Temprano? La taoflora de cerro Centinela Chile, VI Región: vegetación y clima de Chile central a fines del Mioceno—comienzos del Plioceno. From the Eocene of Vegetable Creek. Comparisons and remarks There is no similar fossil taxon in the literature.

Das trockenelement in der alttertiären flora mitteleuropas auf grund paläobotanischer forschungen in Ungarn

Australian Journal of Botany 49: 321—332. Historical Biology, published on line 27 June 2018. The principal climatic indicators which studied are the Eocene fossil floras of Laguna del Hunco Chubut , Río Pichileufú Río Negro and Lota-Coronel Chile.
