Геологическое строение острова обуславливает, при наличии хорошо выраженного по всему побережью

бенча, существенные различия в образовании береговых и прибрежных форм рельефа его южного тихоокеанского и северного берингоморского побережий как по геоморфологическому строению, так, соответственно, и по литодинамическим особенностям осадконакопления.

Geologija

Napokon su geolozi dobili jednostavnu i sveobuhvatnu teoriju kojom mogu objasniti gotovo sve geološke procese: od rasporeda i , preko izdizanja planina sve do i tipova magmatizma. В целом, для побережья всего острова отмечаются следующие общие закономерности геоморфологического строения и распределения вещества в зоне пляжа.

Geological localities

The areas covered by these districts broadly correspond with the larger regional-geological units. It is very important to reduce the risks associated with slope deformations to the lowest possible level. Of the total number of 3060 localities listed on the Internet, more than 50% are accompanied by photographs June 2018.

Geological localities

В настоящее время остров испытывает медленное поднятие.

Geologija

The descriptions of the localities are completed by general information concerning the record itself, followed by a short bibliography and notes about how the data was compiled and updated. Anyhow, even in the second phase of Recent Pleistocene glaciation the Bering and MednyIslands

represented the united land and the coast line of which lay approximately along 100-200-meter isobaths. B — Significant geological localities recommended for protection.
