The theorem states that an Artinian semisimple ring  $R$  is isomorphic to a of finitely many  $n_i$ -by- $n_i$  over  $D_i$ , for some integers  $n_i$ , both of which are uniquely determined up to permutation of the index  $i$ . Many authors use the term noncommutative ring to refer to rings which are not necessarily commutative, and hence include commutative rings in their definition.
