

# Comparison of the radiation balance over a swamp and short grass.

## - - 7(i) Net Radiation and the Planetary Energy Balance

Raunkiaer life form classification system based on location of the perennating bud.		
Life form	Location of perennating tissue	Plant types
Phanerophyte	>0.5 m	Trees and tall shrubs
Chamaephyte	0 - 0.5 m	Small shrubs and herbs
Hemicryptophyte	Soil surface	Prostrate shrubs or herbaceous plants that dieback each year
Cryptophyte	In the soil	Rhizomatous grasses or bulb forming herbs
Therophyte	Seed	Annuals

### Adapting observationally based metrics of biogeophysical feedbacks from land cover/land use change to climate modeling

Albedo change causes cooling, especially over Northern Hemisphere high latitudes. Of this emission only 6 units are directly lost to space.

### Discuss the basics of grass growth.

The light that makes it through the atmosphere to the land surface is mostly absorbed, but some is reflected.

### Radiation Sources and Doses

Contribution of Working Group I to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change eds Stocker, T.

### Discuss the basics of grass growth.

For spatial applications, grid-cell based two-big-leaf models have been proven to be computationally efficient Wang and Leuning with good accuracy compared to more complex multi-layer models Zhang et al. Email , Principal Investigator, with any questions about the content of this site. Nevertheless, locally derived decomposition functions replacing Eqs.

### Discuss the basics of grass growth.

The decomposers, which are the and , feed on the organic matter to meet the energy requirements. With regard to the field data of structural plant traits presented in Table , the average leaf are index of bracken 2.

### The evaporation from a swamp

This native perennial is a primary food source for the Monarch butterfly providing large leaves for caterpillars and big pink globe-like flowers that

provide nectar for the adult butterflies. Even if PAR absorption of diffuse solar radiation  $I_{d0}$  and scattered diffuse radiation  $I_{dif}$  is higher for *Setaria* on the sunny day, this cannot compensate for the higher gain of direct beam PAR absorption by bracken fronds.
