

# Inference from stratified samples I - large sample properties of the linearization, jackknife and balanced repeated replication methods

Carleton University - [PDF] Jackknife and Bootstrap Methods for Variance Estimation from Sample Survey Data

Description: -

-

Estimation theory.

Sampling (Statistics) Inference from stratified samples I - large sample properties of the linearization, jackknife and balanced repeated replication methods

-

no. 155

Carleton mathematical series ; Inference from stratified samples I - large sample properties of the linearization, jackknife and balanced repeated replication methods

Notes: Bibliography: leaves 29-30.

## Resampling (statistics)

Subsets of the data are held out for use as validating sets; a model is fit to the remaining data a training set and used to predict for the validation set. Indeed, ReGenesees allows the specification of calibration models in a symbolic way, using R model formulae.

## A conditional perspective of weighted variance estimation of the optimal regression estimator

However, the bootstrap variance estimator is not as good as the jackknife or the BRR variance estimator in terms of the empirical results.

## Resampling (statistics) : definition of Resampling (statistics) and synonyms of Resampling (statistics) (English)

For example, it is possible in this manner to construct a permutation , a permutation of association, a permutation version of Aly's test for comparing variances and so on. These Taylor series estimates in the statistical programs are coupled with procedures for regression, cross-tabulation, and univariate analyses.

## \*Resampling methods

When sample sizes are very large, the Pearson's chi-square test will give accurate results. The full 1880 census 1% sample replication has variance estimates that are on a different scale than the replications of the 1% IPUMS file, which are based on a sample of only 0.
