The effect of SODIS water treatment intervention at the household level in reducing diarrheal incidence among children under 5 years of age: a cluster randomized controlled trial in Dabat district, northwest Ethiopia

Cluster Randomized Controlled Trial of the Plastic BioSand Water Filter in Cambodia. More successful programs provided an effective HWTS method, with the necessary supplies and training provided, to households with contaminated water who were familiar with the method before the emergency. A generalized estimating equation GEE with a log-link Poisson distribution family and the exchange working correlation, with robust standard error SE estimation, was used for the analysis of repeated observations of diarrhea in individuals over time to consider the clustered nature of the data.

Facilities and services

The average size of a cluster was 28 children.

Facilities and services

Lessons learned from conducting six multi-country mixed-methods effectiveness research studies on water, sanitation, and hygiene WASH interventions in humanitarian response. In the case of piped water supply by utilities compliance was highest at 88%.

Baptist Drilling

Re-interviewing 5% of the households and rechecking the filled questionnaire on a daily basis, together with the feedbacks, were conducted by the supervisors. The strategy document does not include a diagnostic of the current situation.
