To southerners, it's a near-constant companion of Sirius, seen from October through May. The crescent Moon will lie close to Venus on the 11th, making a nice spectacle and a great opportunity to take photos. The jaw-dropping Jewel Box cluster NGC 4755 is best seen through a small telescope, which can reveal more than a hundred sparkling blue jewels around a single red star.

**Monthly star guide: What to see in the night sky in August 2021**

A view of the iconic Omega Centauri globular cluster.

**Monthly star guide: What to see in the night sky in August 2021**

Like what you see here? Its likeness to a male figure was probably obvious to the earliest humans.

The Moon The Moon always makes a great target for a small telescope, which come into view as its phases change. Note: The sky will appear much the same from other cities at similar latitudes, such as Perth or Wellington, at around 10pm local time. We also now offer the option to turn off the Sun, in order to show which stars are up during the daytime.
