The Delphic Boat — What Genomes Tell Us.

In silico pharmacology for drug discovery: methods for virtual ligand screening and profiling

However, much work remains in this area for the successful extrapolation of in vitro-in vivo data and in furthering the development of reliable and accurate models. However, computer sciences rapidly ceased to be a simple tool in drug discovery and pharmacology and became a major contributor to progress.

Role of Oatp2b1 in Drug Absorption and Drug

Commercially available tools such as Diva and Spotfire have been widely used for analysis of ADME and physicochemical property data , ; or integrated into proprietary decision support systems , whereas newer methods are also available with similar 3D graphing and filtering options. Multiple active site corrections for docking and virtual screening. The same approach was also used to forecast potential toxicity problems and for the identification of protein targets implicated in side effects of small molecules, with an estimated prediction success rate of 83%.

In silico pharmacology for drug discovery: methods for virtual ligand screening and profiling

Similarity-based approaches to virtual screening. It has also been suggested that if we are to build on the advances of the human genome, we need to integrate computational and experimental data, with the aim of initiating in silico pharmacology linking all data types.
