Primary Immunodeficiency (PI)

The disease is characterized by high levels of certain immune cells starting in infancy, an enlarged spleen, enlarged lymph nodes, immunodeficiency, and an elevated risk of lymphoma, a type of cancer.

Primary Immunodeficiency (PI)

The treatment of innate immunodeficiency disorders varies depending on the type of defect, but may involve antifungal and antibiotic prophylaxis, cytokine replacement, vaccinations and bone marrow transplantation. Glycosylation refers to the attachment of sugars to proteins, a normal process required for the function of healthy cells.

About Primary Immunodeficiencies

Even with treatment, most PI do not have a cure. Your doctor may refer you for. People with the disease have a weakened immune system and experience frequent bacterial and viral infections.

Primary Immunodeficiency Disease

There are some cases where the disorder can occur spontaneously, not related to genetics at all, and cause a part of the immune system to not function properly. CTLA4 deficiency is a rare disorder that severely impairs the normal regulation of the immune system, resulting in conditions such as intestinal disease, respiratory infections, autoimmune problems, and enlarged lymph nodes, liver, and spleen. Symptoms of this disease begin early in life and include swelling of the lymph nodes, low blood cell counts, and autoimmunity that can affect multiple organs and tissues.
