

# Environmental effects of civil aircraft in flight - special report

Royal Commission on Environmental Pollution - The Royal Commission on Environmental Pollution

Description: -

Air -- Pollution.

Pollutants.

Aircraft exhaust emissions.

Pollution -- Environmental aspects.environmental effects of civil aircraft in flight - special report

-environmental effects of civil aircraft in flight - special report

Notes: Includes bibliographical references.

## Assessment of noise in the airplane cabin environment

Aircraft noise and cardiovascular disease near Heathrow airport in London: small area study.

## Aircraft emissions

Like any other organisations, airports are being challenged to recycle and re-use waste wherever possible. It has a long life cycle and plays a key role in climate change.

## Information on the environmental impact of aviation

The aircraft look the same as they always do: a cigar-shaped fuselage with a big tail or fin also known as vertical stabilizer with rudder, powered by pod-like engines hanging from a pair of extended wings. The air carrier recently decided to invest in the construction of a plant that will turn household and commercial waste into fuel to be used for the airplanes operated by British Airways. Another example from North America comes with the case of Alaska Airlines.

## Assessment of noise in the airplane cabin environment

Nevertheless, FAA believes they could increase capacity by 10 percent or more in several important airports with significant delay problems, such as Newark, La Guardia, and Philadelphia FAA 2001.

## [PDF] Airport Risk Assessment: Examples, Models and Mitigations

This paper develops a methodology to determine optimal flight trajectories that minimize the total flying cost in a dynamic, contrail-sensitive environment.

## **Aviation and the Global Atmosphere: A Special Report of the ...**

Non-CO<sub>2</sub> impacts are also expected to have increased, roughly in proportion to fuel use. The IPCC estimated that the overall impact on global warming of aircraft could be between two and four times that of their CO<sub>2</sub> emissions alone, though there is no scientific consensus about the size of this multiplier. As is noted, pilot performance is a major factor in aviation accidents, especially in GA.
