## The Hakaluki Haor

These give prominence to overall importance for wildlife, especially waterfowl, and characteristics such as representativeness, uniqueness, high ecological diversity, and presence of threatened species. Most of these species have survived because they have been able to adapt to, and in some cases benefit from, man's changes to the environment.

Socio

In joining it the countries are required to designate suitable wetlands within their territories for inclusion in a special list. Reed swamp Reed swamp panjaban is adapted to lands intermediate in height between the haor basin and homestead lands kanda , typically on ridges out in the haors. It was also concluded that during May and June, there was an increase in the number of species which coincided with the beginning of the southward migration of waders and other birds.

① Hukaluki Haor is a marsh wetland ecosystem of north

The wetland also generates a series of economically important ecosystem services, which function to underpin, support and safeguard essential production and consumption processes. A more important factor may be the effects of constant disturbance on the species' energetics.

① **Hakaluki Haor** is a marsh wetland ecosystem of north

Floodplain grassland prefers reasonably well-drained land affected by flooding of fairly short duration, typically found in plain lands between a haor basin and steep hills. It was subsequently established that the peak population occurs in January and that the February 1992 population was, in fact, post-peak. Only in Tangua Haor, Matian Haor and Gurmar Haor complex in the north are there sufficiently large tracts of relatively undisturbed wetlands to support the less adaptable species, and several species are now almost entirely confined to this part of the basin.

## **Poverty status of a critical wetland area : Hakaluki Haor**

To implement a management strategy for the haor resources, it is important to understand the connectivity of people with this land.

### **Evaluation Detail**

Some other incidences were reported by the respondents as detrimental for the existence of Hakaluki haor.

### **Wetland ownership and management in a common property resource setting: A case study of Hakaluki Haor in Bangladesh**

Freshwater Wetlands in Bangladesh: Issues and Approaches for Management. These surveys show that despite the massive habitat losses, the haor basin remains an internationally important wintering area for migratory waterfowl, principally ducks and shorebirds.

### **CAB Direct**

The dense aquatic vegetation provides nesting habitat for a variety of species.
