The study of quantum fluids, stimulated by the discovery of superfluidity in liquid helium, has experienced renewed interest after the observation of Bose-Einstein condensation BEC in ultra-cold atomic gases and the observation a new type of quantum fluid with specific characteristics derived from its intrinsic out-of-equilibrium nature. Their lectures provided a detailed coverage of the experimental techniques for the creation and study of BEC, as well as the theoretical foundation for understanding the properties of this novel by: This book brought together many leaders in both theory and experiment on Bose-Einstein condensation in gases.

Since an atomic Bose-Einstein condensate, predicted by Einstein inwas first produced in the laboratory inthe study of ultracold Bose and Fermi

gases has become one of the most active areas in contemporary physics. Microscopic theory of the Bose gas 9. In Einstein predicted that at low temperatures particles in a gas could all reside in the same quantum state.
