Figure 1. A schematic diagram of the proposed model architecture. The input sequence  $x_1, x_2, \dots, x_n$  is processed by a sequence of hidden layers  $h_1, h_2, \dots, h_m$ . Each layer  $h_i$  consists of two parallel paths: a main path and a residual path. The main path processes the input sequence sequentially, while the residual path processes it in parallel. The outputs of the main path and the residual path are combined to produce the final output of the layer. The final output of the layer is then passed to the next layer in the sequence.
