RAPD markers associated with salt tolerance in *Acacia auriculiformis* and *Acacia mangium*

This study examines the effects of Acacia canopy on soil fertility and cereal productivity. Thus, trace elements will continuously react with various components in soil after they entered into soil regardless what forms they are.

RAPD markers associated with salt tolerance in *Acacia auriculiformis* and *Acacia mangium*

Germination was completely inhibited when seeds were imbibed in the absence of oxygen; germination occurred at 5% oxygen and higher levels.

acacia seyal var: Topics by Science.gov

. A great variability of salt tolerance was found among the strains with a lack of correlation between the genetic diversity of mesorhizobia, their salt tolerance and the soils samples characteristics. In addition, the enzymatic and nonenzymatic methods were employed to evaluate the anti-oxidative effects of the tested extracts.
