stomach and the jejunum small intestine.

### Chronic Pancreatitis in Children

Those at risk for chronic pancreatitis are children who have genetic, metabolic or anatomic abnormalities that predispose them to having multiple episodes of acute pancreatitis. The exocrine cells acinar cells of the pancreas produce and transport chemicals that will exit the body through the digestive system. The median age of diagnosis is 70, but one tenth of a percent of cases occur in people under the age of 20.

### Pancreatic tumors in children: radiologic

A chemical that causes a reaction in other substances, in this case as a part of the digestive process. Use the slider below to see adenocarcinomas

### Childhood Pancreatic Cancer Treatment (PDQ®)

The six patients were between three weeks old and 16 years. Although rare in pediatrics, acinar cell carcinoma is more common than ductal cell adenocarcinoma, the most common pancreatic carcinoma in adults.

### Pancreatic tumors in children: report of three cases

Many benign tumors don't need treatment, and the majority of those that do are curable. For example, a gastrojejunostomy is a surgical procedure that connects the

and other types of exocrine pancreas tumors as they look under a microscope.

### **Cystic Pancreatic Mass in a Child**

Permission to use images outside the context of PDQ information must be obtained from the owner s and cannot be granted by the National Cancer Institute. Lymph nodes are connected to each other by lymphatic vessels.

### **Pancreatic tumors in children: report of three cases**

Some tumors of the pancreas, including the serous cystadenomas and intraductal papillary mucinous neoplasms, form cysts. The degree of risk depends on the underlying cause of pancreatitis and should be discussed with your doctor.
