1.5 Planning, Organizing, Leading, and Controlling

When effective, these policies result in increased coverage rates, better prescribing patterns, and increased adherence to clinical guidelines.

Four Best Practices for Strategic Planning

Limited data indicate, however, that high-quality care can be provided even in environments with severely constrained resources.

Four Best Practices for Strategic Planning

However, they were unable to link those indicators to improvements in health outcomes. Design and redesign interventions assume that simply adding a new resource or a new process in isolation will not improve care because better care is the product of many processes working together. The second priority should be to increase the evidence base regarding the effects on provider behavior of public policies concerning quality of care and whether they lead to better health outcomes.

Four Best Practices for Strategic Planning

At a time when technological progress is blurring industry boundaries, when globalization is expanding geographic horizons, and when new competitors are arising from emerging and adjacent markets, it is more important than ever to be prepared strategically, to be able to look sideways, and to have a sound strategy firmly coupled with a system to translate it into action. Although the experience of researchers implementing interventions that are based on system redesign in the developing world has been largely positive, it is not clear whether the resources and leadership exist to bring these interventions to scale through country or regional policies. A 2002 study found that physicians complied with evidence-based guidelines for at least 80 percent of patients in only 8 of 306 U.

1.5 Planning, Organizing, Leading, and Controlling

Interventions that improve quality have an especially high social value when they have large positive externalities for instance, when better process reduces the incidence of a communicable disease.
