

Towards Estimation of the Static Interregional Attraction Model For the Netherlands - an Application of Spatial Econometrics.

s.n - Application for developing countries: Estimating trip attraction in urban zones based on centrality

But... let's see an example: Spatial lag models for nash equilibrium

- For nash equilibrium ... (Patacchini, Choen Cole, Zenou 2011)

$$q_{ik} = c \left(\frac{1}{\phi M} \sum_{j=1}^{n_k} \beta_{jk} q_{jk} + v_{ik} \right) \quad i = 1, \dots, n_k; k = 1, \dots, K$$

ENDOGENOUS EFFECT: Nothing but the Spatial autoregressive component of SAR model

Description: -

- Towards Estimation of the Static Interregional Attraction Model For the Netherlands - an Application of Spatial Econometrics.

-
Netherlands Economic Institute Series: Foundations of Empirical Economic Research -- 76/12Towards Estimation of the Static Interregional Attraction Model For the Netherlands - an Application of Spatial Econometrics.

Railway and road infrastructure in the Belt and Road Initiative countries: Estimating the impact of transport infrastructure on economic growth

When instead only B_{ij} is allowed to have an effect by setting δ to zero, shows what happens when border impediments are decreasing in case of an interregionally immobile labour force.

Accessibility modeling and evaluation: The TIGRIS XL land

Stability is checked by equally shocking half of the regions in terms of number of workers in a or in terms of number of workers in manufacturing in b. Appendix C Labour mobile but only within countries As intranational labour mobility is much higher in Europe than international labour mobility, and to complement the discussion in , shows the simulated LRE distribution of economic activity that results when allowing people to move interregionally, but only so within their country of residence.

Isard's contributions to spatial interaction modeling, Journal of Geographical Systems

In our study, we have advocated a conceptualisation of dynamic border phenomena based on a human-constructed establishment of borders, evolving from a walled fortification to a new enabling opportunity space. Similar agglomeration but different regional distribution. In the larger States, where a high level of local consumer demand typically exists, personal income is sometimes substituted.

Regional Science Matters: Studies Dedicated to Walter Isard

The values of the t-tests are shown in brackets below the coefficients.
