Hydrographische Bibliographie

In particular, insights into the following unresolved problems were evaluated.

The oceans and marine geochemistry

Flat-lying sedimentary rocks devoid of faults and strong joints and the flat glacial deposits of the Pleistocene Epoch from 2,500,000 to 10,000 years ago exert no structural control at all: this is reflected in branching networks. Mountain ranges that formerly were glaciated contain falls at the outlets of cirques , bowl-shaped depressions in the headwaters of drainage areas that were formed by the accumulation of ice and its erosive action on the underlying bedrock. In 2015—2016, a massive mangrove dieback event occurred along~1000 km of coastline in Australia.

OS

In our case the intermicellar and vacant octahedral sites could have adsorbed the Fe, Ca, and Mg cations. The theory and method of three techniques to be used in the analysis of suspended sediment have been outlined.

Reactivity and transport of nutrients and metals in the St. Lawrence Estuary

Marine Biol. This work highlights that iron Fe dynamics plays a key role in the release of alkalinity from sediments, as exemplified for the Baltic Sea. Equation 1 simply states that the sediment accumulation V_a is equal to the cumulative volume percent first term coarser than x_i with settling time T_i plus the time dependent fractions second term of the fines sizes.
