## Evaluating the effectiveness of GP endorsement on increasing participation in the NHS Bowel Cancer Screening Programme in England: study protocol for a randomized controlled trial

How much do different factors influence COVID-19 mortality risk versus all-cause mortality risk? The most significant difference is that where the ICD employed a 3-digit code, a '0' was added at the end in the dataset to ensure that all codes had 4 digits. This is relevant considering recent reports of suicidal ideation in clinical trials for PsA and, to our knowledge, is the first population-based estimate of the risk for suicide in PsA and RA.

## Changes in proportional mortality from diabetes and circulatory disease in Mauritius and Fiji: possible effects of coding and certification

Data recruitment was supported by grants from the Danish Medical Research Council project no. Feasibility If the GP endorsed reminder is successful, we expect around 140 FOBt kits to be returned by patients randomised to the intervention arm of the trial. Timing of excess deaths Italian men were the first group to experience a rise in mortality, with the first week of March 2020 as the earliest week in which the posterior probability of an increase in deaths was more than 90%.

## Evaluating the effectiveness of GP endorsement on increasing participation in the NHS Bowel Cancer Screening Programme in England: study protocol for a randomized controlled trial

Examining trends in cause-specific proportional mortality is always fraught because such trends are not independent of changing contributions to overall mortality from other unrelated causes. Statistical analysis Descriptive statistics were used to examine age, sex, baseline covariates, person-time, covariate distribution and causes of death among the four groups.

## Lifetime risk of being diagnosed with, or dying from, prostate cancer by major ethnic group in England 2008

However, lack of reliable mortality data for Fiji in the WHO database from before the introduction of ICD—10 precluded assessment of proportional mortality from this earlier period. In addition to the genetic disposition of both physical , and psychiatric diseases „, psycho-social consequences following parental death may play a significant role ,.

### **Evaluating the effectiveness of GP endorsement on increasing participation in the NHS Bowel Cancer Screening Programme in England: study protocol for a randomized controlled trial**

We hypothesised that these proportions may be artefactual and possibly related to mortality coding changes, from ICD—9 to ICD—10. Data from The Health Improvement Network is supported by the Clinical and Translational Science Award at the University of Pennsylvania 8UL1TR000003 from the National Center for Research Resources. As a result of these differences, although France and Spain have reported similar numbers of deaths assigned to COVID-19, all-cause mortality increased by twice as much in Spain as in France.

### **Historic Mortality Datasets**

We used two sets of models, one without temperature and one with a weekly term for temperature anomaly, defined as deviation of weekly temperature from the local average weekly temperature over the entire analysis period. Competing interests: The authors have declared that no competing interests exist.

### **Changes in proportional mortality from diabetes and circulatory disease in Mauritius and Fiji: possible effects of coding and certification**

The parametrization of these models was based on the partial auto-correlation function of the sequence  $\phi_j$ . Divergent mortality trends by ethnicity in Fiji. Li J, Precht DH, Mortensen PB, Olsen J 2003 Mortality in parents after death of a child in Denmark: a nationwide follow-up study.
