## Mapping under

HIV infection has added considerably to the burden of diarrheal diseases among adults and children. We thus examined the medians of the proportions for studies carried out in Sub-Saharan Africa in different time periods. In addition, we considered keywords for specific etiologies known to cause diarrhea in children.

## West African sources of health and mortality information : a comparative review

Only 37 out of 54 African states have some level of pharmaceutical production. It is expected that by the year 2020 these figures will rise to 400 million and 500 million, respectively. A systematic review of the literature was conducted on 66 published peer reviewed articles.

## A comparative review of mobile health and electronic health utilization in sub

The main limitation of using currently available national survey data to estimate diarrhea morbidity is the cross-sectional nature of data collection. In an attempt to update these estimates, reviewed articles published between 1980 and 1990. This is an Open Access article under the CC BY 4.

## West African sources of health and mortality information (1988 edition)

Simple Medians of Diarrhea Proportional Mortality As a first approach to estimating the number of deaths due to diarrhea among children younger than five years of age in the African region for the year 2000, we applied the median of the proportions of diarrhea deaths to the total number of deaths among children under five in each of the two African subregions.

## West African sources of health and mortality information : a comparative review

Some studies of childhood deaths in developing countries have shown that causes of death established using verbal autopsy methods are not always consistent with diagnoses based on more complete clinical data ;. These correspond to a total 783,000 deaths for the whole region. Pixels coloured green to yellow can meet the SDG 3.

## **West African sources of health and mortality information (1988 edition)**

Available Etiology Data, by Country and Study Setting.

### **Dying from lack of medicines**

Relative uncertainty was computed as the ratio of the 95% uncertainty intervals and under-5 mortality rate for each pixel. However, the number of observations, varying from three to five, is low for all three studies, and the uncertainty that prevails because of this low number and the different sites where the studies were carried out should be taken into account when interpreting these data. These colours overlap such that areas coloured purple have both high under-5 mortality rates and high relative uncertainty.
