## Agriculture

To assess the effectiveness of over-winter seed provision by agri-environment schemes, bird use of patches of seed-bearing crops was compared with that of other seed-rich habitats on 53 farms in eastern Scotland over three winters. An example of this would be the use of CA has not spread as quickly as most conservationists would like.

## Environmental management scheme

It was the first scheme in Wales, and indeed in Europe, aimed at promoting whole farm conservation and management. The practices of CA and grazing livestock on a field for many years can allow for better yields in the following years as long as these practices continue to be followed. Out-of-production schemes tend to be used in practices where the farming land is widespread and less is practiced , and focus on improving or setting land aside that will not be used for the production of food, for example, the addition of wildflower strips.

## The Agri

As the changes in practices that ensure the protection of the environment are costly to farmers, the EU developed agri-environment schemes to financially compensate individual farmers for applying these changes and therefore increased the implementation of conservation agriculture. These organizations can help to inform, conduct research, and buy land in order to preserve animals and plants New Standard 1992.

## Agriculture

Another way in which CA is looking to the future is through prevention.

## Agriculture

Agriculture therefore plays a key role in land management and has a huge responsibility in the preservation of natural resources.

## Farming for Nature

The third principle is the practicing diverse or crop interactions. Producers will find that the benefits of CA will come later rather than sooner. In-production schemes used for a smaller scale, but more intensively farmed land focus on the sustainable management of arable crops or grassland, for example reduction of pesticides, reduction of grassland mowing, and most commonly, organic farming.
