Exploring all possibilities for the true benefit of the photographer

The L-Mount Alliance is an experiment by three camera manufacturers, each with a rich history of developing camera gear independently, to overcome the limitations faced as a single manufacturer and offer greater freedom thanks to the adoption of a shared lens-mount standard: the L-mount.

PUBLICATIONS

After each scan point, the time counting process was re-set to a common starting reference at the time-interval analyzer. The total variation restoration algorithm has shown promising results in reconstructing images using data with much less than one photon per pixel. Rather than using mirrors in its construction, the camera was built with a mirrorless design featuring a live viewfinder.

OSA

This demonstrates that the RDI-TV algorithm allows detailed identification of the clock face and restoration of the missing pixels with the acquisition time of 27. The use of lower power laser sources means that single-photon detection will have greater level of covertness and is less likely to exceed eye-safety thresholds.

OSA

Alù, Chiral effects in plasmonic metasurfaces and twisted metamaterials, in Singular and Chiral Nanoplasmonics, edited by N. Even with the scale of our business, quickly developing a range of cameras to satisfy many different target markets is not an easily achievable goal, but thanks to the power of our alliance our customers are offered a new wealth of options. Subsequently, the scan was taken with the system positioned with the riflescope centered at the point B, overlapping the previous scan area by approximately 35% 35 pixels.
