## Lithotripsy

What type of diet can be helpful in the prevention of transurethral lithotomy? Decreasing the consumption of oxalate-rich foods, such as spinach, peanuts, beets, tomato, potato chips, and chocolate, can reduce the risk of developing calcium-type kidney stones. Similar to kidney stones, the most critical factors to prevent the necessity of transurethral lithotomy is to avoid a severe reduction in producing urine per day sometimes less than 1 liter.

## Transurethral Lithotomy

The drainage is filtered to trap the particles so that they can be sent to the laboratory for analysis. The impedance of calculi is different from that of water, bone, and soft tissue; therefore, tissue through which the wave travels as well as tissues surrounding the stone are not harmed. ESWL is not appropriate for every patient with kidney stones.

## Choledochoscopic electrohydraulic lithotripsy and lithotomy for stones in the common bile duct, intrahepatic ducts, and gallbladder.

Ureteral stones are usually associated with symptoms such as severe pain, vomiting, nausea, and in rare cases, urinary obstruction and kidney destruction. However, retrieval of giant gallstones is still difficult because of the limited space in the saddle section of the LAMS.

## Lithotripsy

Electrohydraulic lithotripsy of intrahepatic stones during choledochoscopy.

## Lithotripsy

Some bright red blood in the urine passing through the nephrostomy can be expected for one to three days, but the amount of blood should gradually diminish. Usually, these tests consist of complete physical examination and the assessment of health history.

## Lithotripsy

TUL can be very simple or quite complex. Frequent tests for a transurethral lithotomy candidate include ultrasound of kidneys to make sure symptoms are not due to kidney stones , abdominal X-ray, MRI scan of kidneys and abdomen, retrograde pyelogram and abdominal CT scan.

#### **Efficacy and safety of endoscopic laser lithotripsy and lithotomy through the lumen**

The most common type of kidney stones and ureteral stones is a calcium type.
