## B.R.E. - Guide for authors

### Foundation Loads

- A foundation supports a number of different kinds of loads:
  - Dead Load – of the building which is the sum of the weights of the frame, the floors, roof, and walls.
  - Live Load – which is the sum of the weights of the people in the building, the furnishings and equipment they use, and snow, ice and water on the roof

### Soils and Foundations

As the weight of the building increases in relation to the bearing capacity or depth of good bearing soil, the footing needs to expand in size or different systems need to be used. It is important to ensure that all corrections are sent back to us in one communication.

### Different Soils & How They Affect Foundations

These are almost always reinforced. Please check carefully before replying, as inclusion of any subsequent corrections cannot be guaranteed.

### Liu & Evett, Soils and Foundations, 8th Edition

Safe bearing capacity of soil equals to the ultimate bearing capacity divided by a safety factor usually 2-4. For all courses in soils and foundations, geotechnical engineering, soil mechanics, and foundation engineering.

### Soils and Foundations

Note that color figures or photographs submitted with a manuscript will also appear in color on the web with no charge.

### Soils and Foundations

A PDF file of the paper in its ready-to-print state will be provided free of charge in any case. Non-cohesive soils are granular soils consisting of gravel and sands. Coverage includes: engineering properties of soils; soil exploration, compaction, stabilization, and consolidation; water in soil; subsurface stresses; settlement of structures; shear strength; shallow and deep foundations; lateral earth pressure; retaining structures, and stability analysis of slopes.

### Open access information

They are often post tensioned concrete.
